# Zimbra contacts and calendar with Sailfish OS / Jolla

## Sailfish OS connectors

The standard CardDAV and CalDAV connectors in Sailfish OS cannot handle Zimbra redirect from the path in documents (/dav/username@domain/Contacts and /dav/username@domain/Calendar) so we must punch in the real address instead.

## Zimbra paths

My configuration is using email address as username so the @domain part is included always in the path so I am not 100% sure if we need include @domain in path. Let's presume we don't :) Please comment if I am wrong.

The real path to Contacts CardDAV and CalDAV is

```
/service/dav/home/username/Contacts/  
/service/dav/home/username/Calendar/
```

## Sailfish OS setup

This is straightforward

- Add CalDAV and CardDAV account
- Server <https://mail.server.domain>
- Contacts path /service/dav/home/username/Contacts/ (please comment if needs @domain)
- Calendar path /service/dav/home/username/Contacts/ (please comment if needs @domain)

And that's it!
