# Super quick steps to set up a Pacemaker cluster to Centos 6

This is a quickie to show you how to start do Pacemaker ensured high available Apache with a service IP and KVM virtual host fencing.

## Install software

Install these to every node and virtual host as well

```
yum install fence-virt fence-virtd ence-virtd-multicast fence-virtd-libvirt
```

Install these to pacemaker nodes / guests

```
yum install pacemaker cman pcs ccs resource-agents
```

## Prepare virtual machine fencing

Configure at virtual host, use virbr0, /etc/cluster/fence\_xvm.key

```
fence_virtd -c
```

Make key

```
dd if=/dev/random bs=512 count=1 of=/etc/cluster/fence_xvm.key
```

Configuration should be like this

```
backends {
    libvirt {
        uri = "qemu:///system";
    }
}
listeners {
    multicast {
        key_file = "/etc/cluster/fence_xvm.key";
        interface = "virbr0";
        port = "1229";
        address = "225.0.0.12";
        family = "ipv4";
    }
}
fence_virtd {
```

```
backend = "libvirt";
listener = "multicast";
module_path = "/usr/lib64/fence-virt";
}
```

Start fencing daemon, insert to your rc.local to get it up after boot

```
fence_virtd
```

Test it, you should see your virtual guests

```
fence_xvm -o list
```

Copy the /etc/cluster/fence\_xvm.key to all guests

Test in GUESTS. if timeouts check if you are using other interface at the virtual host, br0 etc

```
fence_xvm -o listen
```

Configure the fencing to your pacemaker cluster later with command

```
crm configure primitive st-virtstonith:fence_xvm
```

## configure your pacemaker

Do this in one node and copy the /etc/cluster to all nodes

```
ccs -f /etc/cluster/cluster.conf --addfencedev pcmk agent=fence_pcmk
ccs -f /etc/cluster/cluster.conf --addmethod pcmk-redirect host1
ccs -f /etc/cluster/cluster.conf --addmethod pcmk-redirect host2
ccs -f /etc/cluster/cluster.conf --addfenceinst pcmk host1 pcmk-redirect
port=host1
ccs -f /etc/cluster/cluster.conf --addfenceinst pcmk host2 pcmk-redirect
port=host2
```

Do this in every node

```
cp /etc/corosync/corosync.conf.example /etc/corosync/corosync.conf
echo "CMAN_QUORUM_TIMEOUT=0">>> /etc/sysconfig/cman
```

## Fire it up

```
chkconfig cman on
```

```
chkconfig pacemaker on
```

```
service cman start
service pacemaker start
```

```
pcs status
pcs config
```

## Start putting the thing to work

Set basic properties

```
pcs property set stonith-enabled=true
pcs property set no-quorum-policy=ignore
pcs resource defaults migration-threshold=1
```

Set up Apache with HA IP

Be sure that your Apache provides <http://localhost/server-status>

```
pcs resource create WebSite ocf:heartbeat:apache
configfile=/etc/httpd/conf/httpd.conf
statusurl="http://localhost/server-status" op monitor interval=1min
pcs resource create ClusterIP ocf:heartbeat:IPaddr2 ip=1.2.3.4 nic="eth0"
cidr_netmask=27 op monitor interval=30s
pcs constraint colocation add WebSite ClusterIP INFINITY
pcs constraint location WebSite prefers host1=50
```

Finally put the nodes to shoot each other when they've get a problem

```
crm configure primitive st-virt stonith:fence_xvm
```
